VERITAS (Very Energetic Radiation Imaging Telescope Array System) is a major ground-based gamma-ray observatory located at the basecamp of the Fred Lawrence Whipple Observatory in southern Arizona. VERITAS comprises an array of four 12m optical reflectors for gamma-ray astronomy in the very high energy (VHE: 50 GeV - 50 TeV) range.

Use the menu on the right to find out more about the techniques of Cherenkov imaging, specifications of the array, who we are, the history of the project, and the agencies that fund this research.

**VERITAS Snapshot:**

- Array of four atmospheric Cherenkov telescopes
- Telescope design is based on Whipple 10m Telescope
- 350 individual mirrors on each telescope reflector
- Each telescope aperture: 12m
- 499 pixel camera on each telescope
- Field of view of 3.5 degrees
- Energy range of 85 GeV to 30 TeV

**VERITAS Science Topics:**

- black holes at the centres of active galaxies
- pulsars
- X-ray binaries
- gamma-ray bursts
- supernova remnants
- globular clusters

- galaxies including our own Milky Way Galaxy
- Galaxy clusters
About VERITAS
Last Updated Thursday, 24 May 2018 14:42

- Dark Matter
- Astroparticle physics
- Unidentified sources

Important Dates:

- April 2003: Installation of VERITAS prototype telescope at the FLWO Basecamp
- February 2004: First light of VERITAS prototype
- January 2007: Completion of 4 telescope array
- April 27-28 2007: First Light Celebration
- Summer 2009: Displacement of Telescope 1 to new location for improved sensitivity
- Summer 2012: Upgrade of camera PMTs to high-quantum-efficiency PMTs

Funding Agencies:
USA

- Department of Energy
- National Science Foundation
- Smithsonian Institution

Canada

- NSERC (Natural Sciences and Engineering Research Council)

External Science Advisory Committee:

- Chryssa Kouveliotou (George Washington University)
- Matthew Baring (Rice)
- Tom Gaisser (Delaware/Bartol)
- Roger Romani (Stanford)
- Gus Sinnis (LANL)
- Laura Cadonati (Georgia Tech)
- Tim Tait (UC Irvine)
